

DECLARATION OF ECO-SUSTAINABLE PRODUCTS

With this document, White Gold Packaging declares that the products supplied, articles in EPS (Expanded Sintered Polystyrene), stretch film and cover sheet, belong to those that can be defined as eco-sustainable, being obtained according to criteria of efficient use of the regenerated raw material, without waste of resources and entirely recyclable.

The Management of White Gold Packaging declares to be always sensitive to all the problems concerning the environment and therefore to pay attention to the issues of production and supply that can be defined as *preferable* for the environment, one of the key points of its way of operating.

Based on this principle:

- Our items in EPS are produced from regenerated raw material, in the percentage of 30%, obtained by carefully selected material recycling processes. This percentage is designed to guarantee the minimization of the use of virgin raw material while maintaining the quality of the expected performances in the ratio between density, compressive strength and insulating capacity, the latter where necessary.
- Stretch film is produced with virgin raw material but complies with the provisions of the UNI EN 13427 standard in terms of recyclability and energy recovery, equal to 22MJ/Kg.
- Cover film is made up of raw material regenerated to a variable extent in the range between 40% and 70%.

Our products in EPS, stretch and cover film can therefore be entirely recyclable. Therefore if they are unable to be recycled or where this choice cannot be pursued for various reasons, they can be disposed in incinerators, recovering the energy stored in them in the production process (feedstock energy), exceeding the threshold value of 15 MJ / Kg.

White Gold Packaging, in collaboration with its Partners, with whom it shares the philosophy of Earth Care, systematically researches and tests new production methods aimed at reducing the percentage of virgin raw material in favor of the regenerated one. So it wants to promote production processes with no waste of resources, particularly for plastic materials, those of a non-renewable fossil nature.

Finally, regarding EPS, White Gold Packaging tries to help its customers to recover the EPS waste, making itself available for its collection, reaching a virtuous life cycle between production and use. Thus, EPS waste can be systematically recycled into production cycle, always making regenerated raw materials available.
